Churn Profile & Insights

This report analyzes the bank’s customer base, focusing on demographic patterns and customer churn behavior.

Overall, the churn rate is 20.4%, with higher churn observed among younger customers and those with lower account balances. Customers with only one product and inactive members are significantly more likely to leave.

Key insights show that churn is strongly linked to low engagement and limited product usage, while customers with multiple products and higher balances are more likely to remain loyal.

The main drivers of churn appear to be low customer engagement and lack of product integration.

To reduce churn, the bank should target high-risk segments with personalized offers, improve customer engagement, and encourage multi-product adoption.

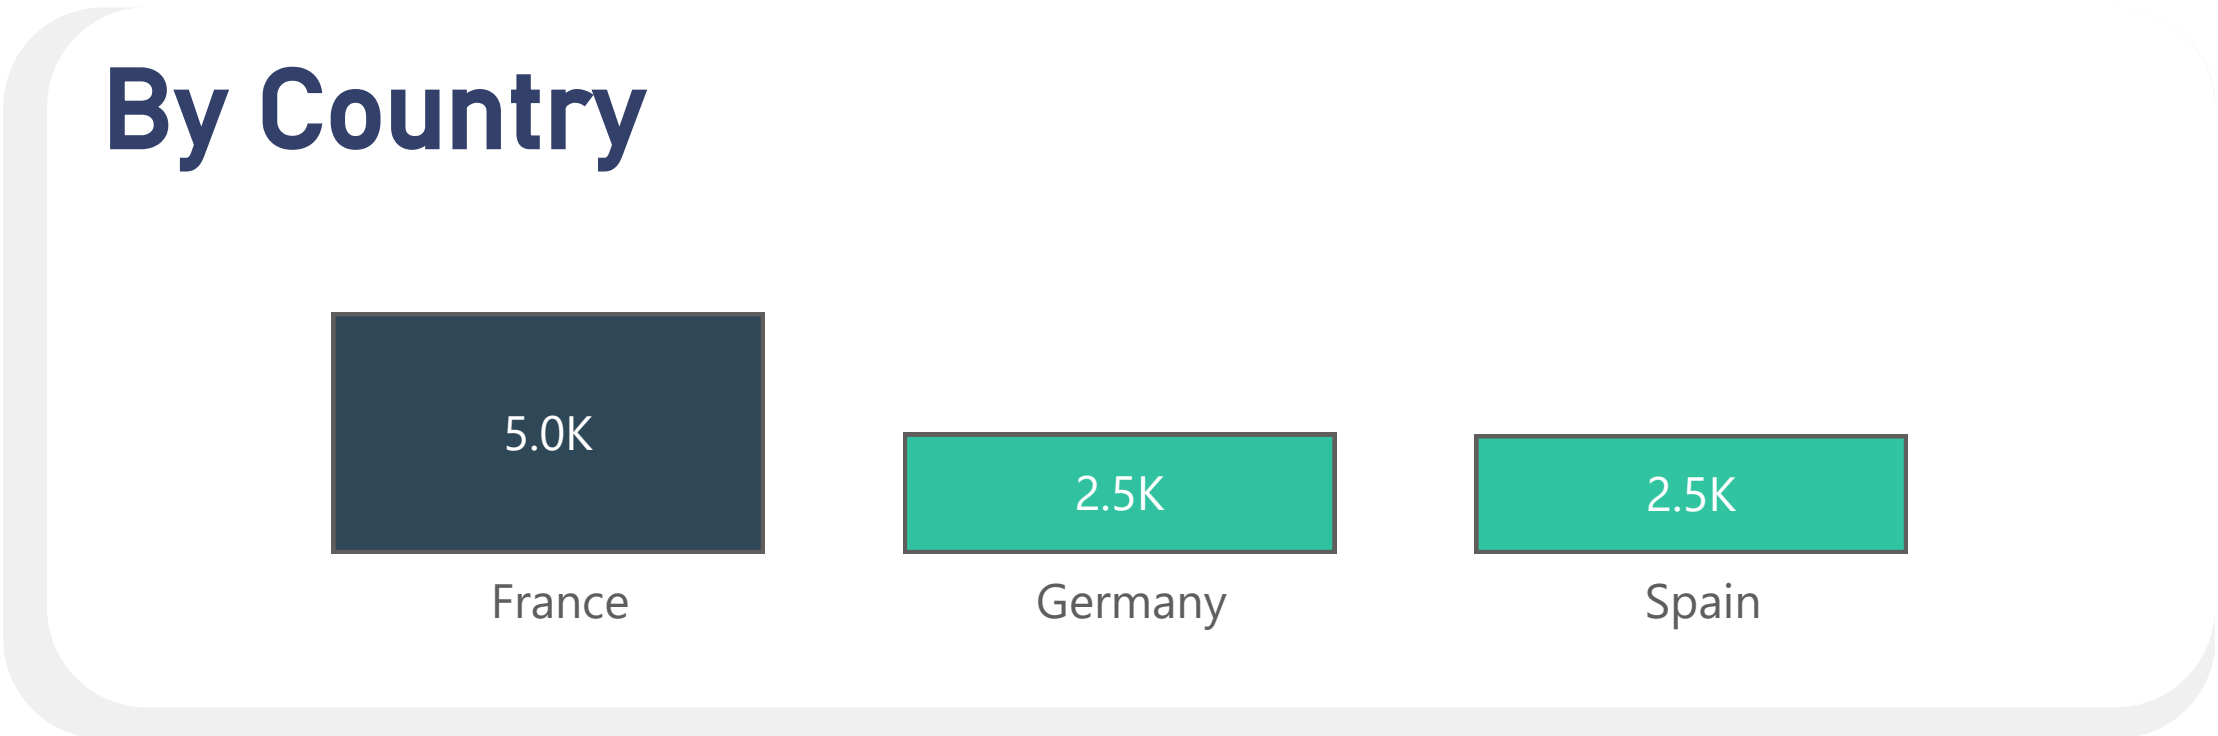

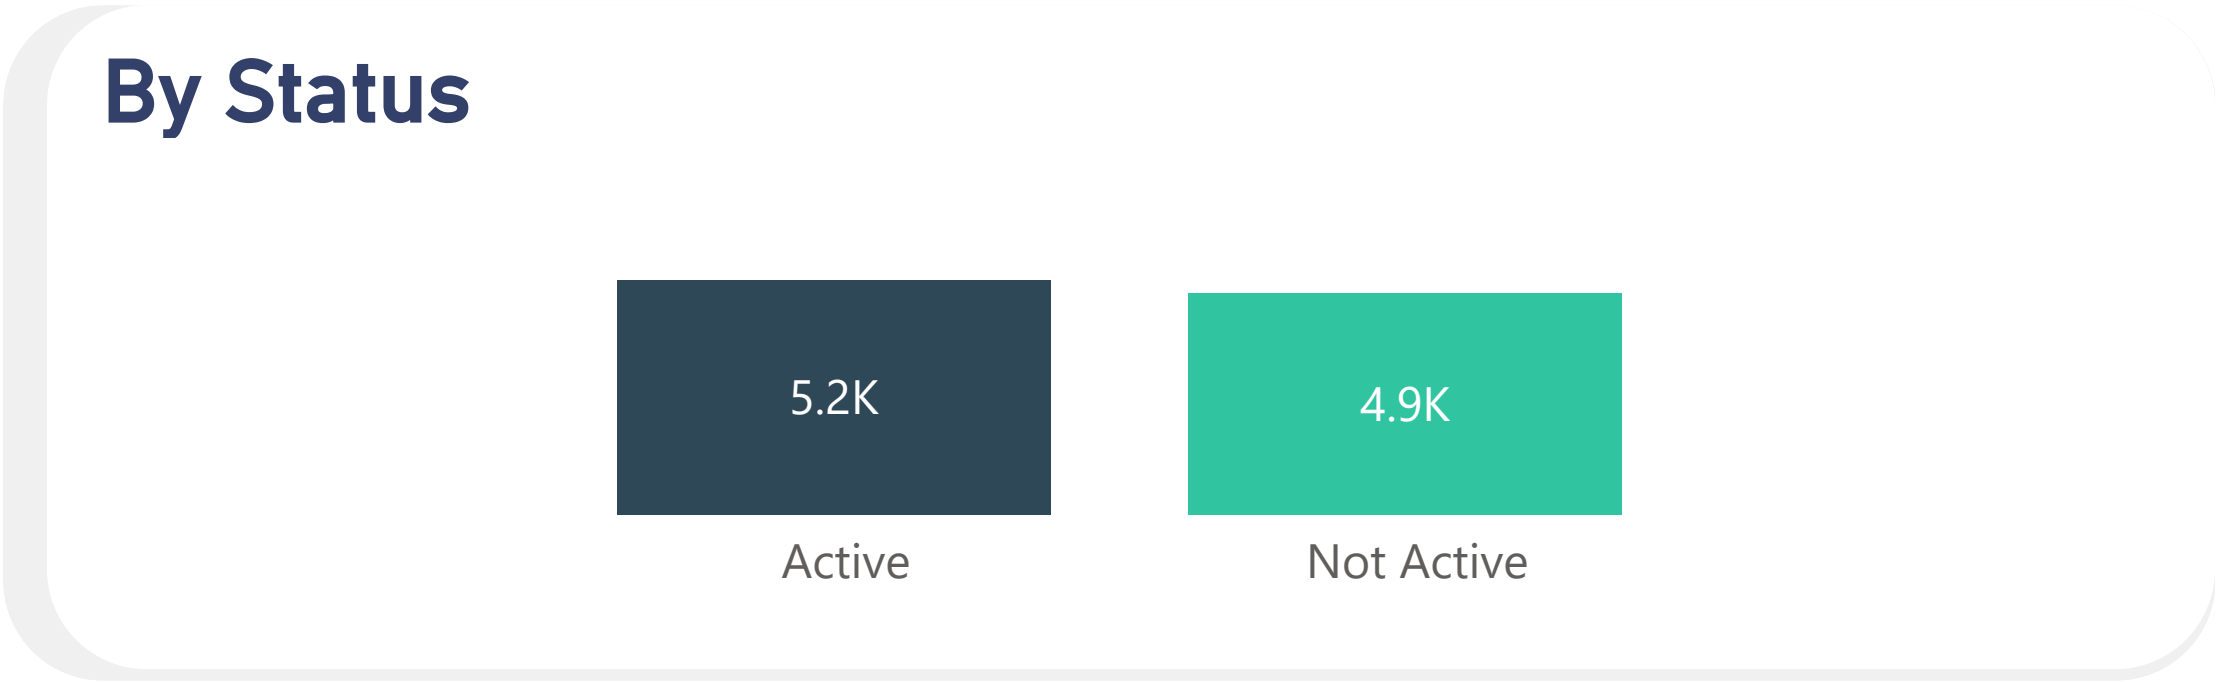

These actions can significantly improve retention and customer lifetime value.

- Focus retention efforts on **middle-aged and adult customers** (roughly 30–59).
- Launch **product-bundling and cross-sell campaigns** aimed at 1-product customers.
- Design **targeted interventions in Germany**, such as tailored offers, service reviews, or proactive outreach, because Germany has the highest count of churned customers in the geography breakdown.
